1. Introduction.

In the paper [13], a 1-D map related to the dynamics of some evolutionary processes (see, e.g. recent surveys on evolutionary algorithms and their applications to the study of chaotic dynamics [14, 15]) was investigated. Later, its extended two-dimensional version was studied in [3]:

$$\begin{pmatrix} x \\ y \end{pmatrix} \mapsto \begin{pmatrix} \frac{-ax}{1+y^2} \\ x + by \end{pmatrix}, \tag{1}$$

where a and b are bifurcation parameters. In the paper "Some Open Problems in Chaos Theory and Dynamics" [4], the following problem was formulated: *Find regions in the a–b plane in which the map* (1) *is bounded and chaotic in the rigorous mathematical definition of chaos and boundedness of attractors.*

In the present paper, the boundedness of the attractors of the map (1) is studied and the corresponding analytical estimation of absorbing set is obtained, thereby giving an answer to the above problem.

Introduce the notation

$$h(y_k) = \frac{-a}{1 + {y_k}^2}, \qquad k \in \mathbb{N}_0. \tag{2}$$

The eigenvalues and eigenvectors of the map are defined by the following relation:

$$\begin{pmatrix} x_{k+1} \\ y_{k+1} \end{pmatrix} = A \begin{pmatrix} x_k \\ y_k \end{pmatrix} + \begin{pmatrix} \frac{a x_k {y_k}^2}{1+{y_k}^2} \\ 0 \end{pmatrix}, \quad A = \begin{pmatrix} -a & 0 \\ 1 & b \end{pmatrix},$$

$$\det(A - pI) = \det \begin{pmatrix} -a-p & 0 \\ 1 & b-p \end{pmatrix} = (-a-p)(b-p) = p^2 + p(a-b) - ab.$$

Thus, the eigenvalues are

$$p = b, \quad p = -a.$$

For the eigenvalue $p = -a$, one has

$$\begin{pmatrix} -a & 0 \\ 1 & b \end{pmatrix} \begin{pmatrix} x \\ y \end{pmatrix} = \begin{pmatrix} -ax \\ -ay \end{pmatrix}.$$

Hence, the corresponding eigenvectors are proportional to

$$\begin{pmatrix} 1 \\ -\frac{1}{a+b} \end{pmatrix}.$$

For the eigenvalue $p = b$, one has

$$\begin{pmatrix} -a & 0 \\ 1 & b \end{pmatrix} \begin{pmatrix} x \\ y \end{pmatrix} = \begin{pmatrix} bx \\ by \end{pmatrix},$$

and, thus, $x = 0$.

Next, the following 4 cases are considered, with the associated properties proved:
$|a| < 1, |b| < 1$: Global asymptotic stability;
$|a| < 1, |b| > 1$: Existence of unbounded solutions;
$|a| > 1, |b| < 1$: Localization of nontrivial global attractor;
$|a| > 1, |b| > 1$: Existence of unbounded solutions.

The cases of $|a| = 1$ or $|b| = 1$ are not considered in this paper, which require special consideration therefore will be discussed elsewhere.

2. Case 1: $|a| < 1, |b| < 1$. Global asymptotic stability.

There exists $\delta > 0$ such that $\max(|a|, |b|) < \delta < 1$. Then, $|h(y_k)| < \delta < 1$, $\forall k$, and

$$|x_k| \le \delta^k |x_0|, \quad \forall k \ge 0.$$

Since $\delta < 1$, one has

$$x_k \xrightarrow[k\to\infty]{} 0.$$

For y_k, one has

$$\begin{aligned} |y_{k+1}| &= |by_k + x_k| = |b^2 y_{k-1} + bx_{k-1} + x_k| \\ &\le |b|^{k+1}|y_0| + |b|^k|x_0| + |b|^{k-1}|x_1| + |b|^{k-2}|x_2| + \cdots + |b||x_{k-1}| + |x_k| \\ &\le |b|^{k+1}|y_0| + (k+1)\delta^k|x_0|. \end{aligned}$$

Taking into account of the fact that $|b| < \delta < 1$, one gets $y_{k+1} \xrightarrow[k\to\infty]{} 0$. Thus, for $|a| < 1, |b| < 1$, the global asymptotic stability is confirmed (see Fig. 1).

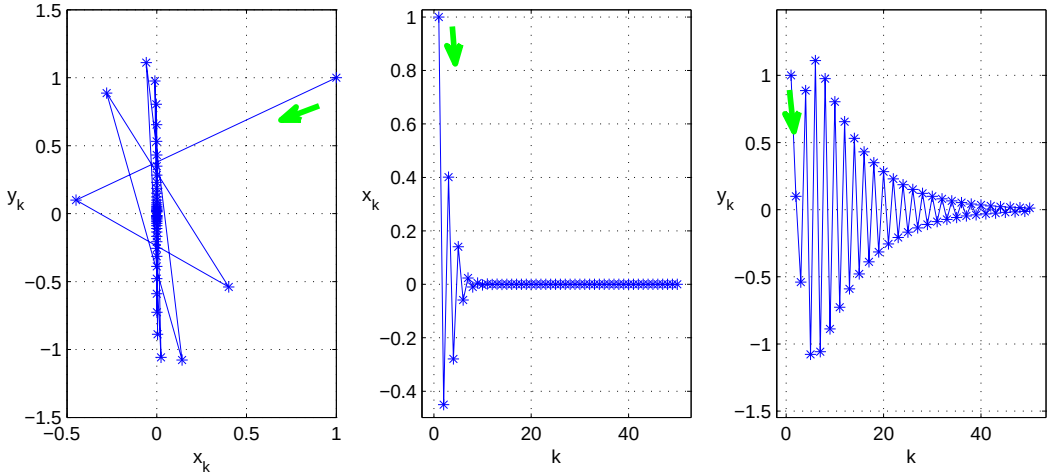

Figure 1: Case 1 ($|a| < 1, |b| < 1$): $a = 0.9$, $b = -0.9$, $x_1 = 1$, $y_1 = 1$, $k = [1, 50]$.

3. Case 2: $|a| < 1, |b| > 1$. The existence of unbounded solutions.

It will be shown that if $|a| < 1, |b| > 1$, then there exists (x_0, y_0) such that

$$|x_k(x_0, y_0)| \xrightarrow[k\to\infty]{} 0, \quad |y_k(x_0, y_0)| \xrightarrow[k\to\infty]{} \infty.$$

For $|a| < 1$, there exists $\delta > 0$ such that $|a| < \delta < 1$. Then, $|h(y_k)| < \delta < 1, \forall k \geq 0$, and

$$|x_k| \leq \delta^k |x_0|, \quad \forall k \geq 0.$$

For y_k, one has

$$\begin{aligned} y_{k+1} &= by_k + x_k = b^2 y_{k-1} + bx_{k-1} + x_k \\ &= b^{k+1} y_0 + b^k x_0 + b^{k-1} x_1 + b^{k-2} x_2 + \cdots + bx_{k-1} + x_k \\ &= b^{k+1} y_0 + b^k \left(x_0 + \frac{x_1}{b} + \frac{x_2}{b^2} + \cdots + \frac{x_{k-1}}{b^{k-1}} + \frac{x_k}{b^k} \right). \end{aligned}$$

Taking into account the fact that $|x_k| \leq \delta^k |x_0|$, where $|a| < \delta < 1$, one has

$$\begin{aligned} |y_{k+1}| &\geq |b|^{k+1} |y_0| - |b|^k \left(|x_0| + \frac{\delta^1 |x_0|}{|b|} + \frac{\delta^2 |x_0|}{|b|^2} + \cdots + \frac{\delta^{k-1} |x_0|}{|b|^{k-1}} + \frac{\delta^k |x_0|}{|b|^k} \right) \\ &\geq b^{k+1} |y_0| - b^k \left(|x_0| + \frac{\delta^1 |x_0|}{|b|} + \frac{\delta^2 |x_0|}{|b|^2} + \cdots + \frac{\delta^{k-1} |x_0|}{|b|^{k-1}} + \frac{\delta^k |x_0|}{|b|^k} \right). \end{aligned}$$

For the sum of the geometric (infinitely decreasing) series, one has

$$S_k\left(|x_0|, \frac{\delta}{|b|} \right) = |x_0| + \frac{\delta^1 |x_0|}{|b|} + \frac{\delta^2 |x_0|}{|b|^2} + \cdots + \frac{\delta^{k-1} |x_0|}{|b|^{k-1}} + \frac{\delta^k |x_0|}{|b|^k} \leq \frac{|x_0|}{1 - \frac{\delta}{|b|}} = \frac{|b||x_0|}{|b| - \delta}.$$

Therefore,

$$|y_{k+1}| \geq |b|^{k+1} |y_0| - |b|^k \left(S_k\left(|x_0|, \frac{\delta}{|b|} \right) \right) \geq |b|^{k+1} |y_0| - |b|^{k+1} \frac{|x_0|}{|b| - \delta} \geq |b|^{k+1} \left(|y_0| - \frac{|x_0|}{|b| - 1} \right).$$

If $|y_0| \geq \frac{|x_0|}{|b|-1}$, then $|y_{k+1}(x_0, y_0)| \xrightarrow[k\to\infty]{} \infty$ (see Figs. 2 and 3).

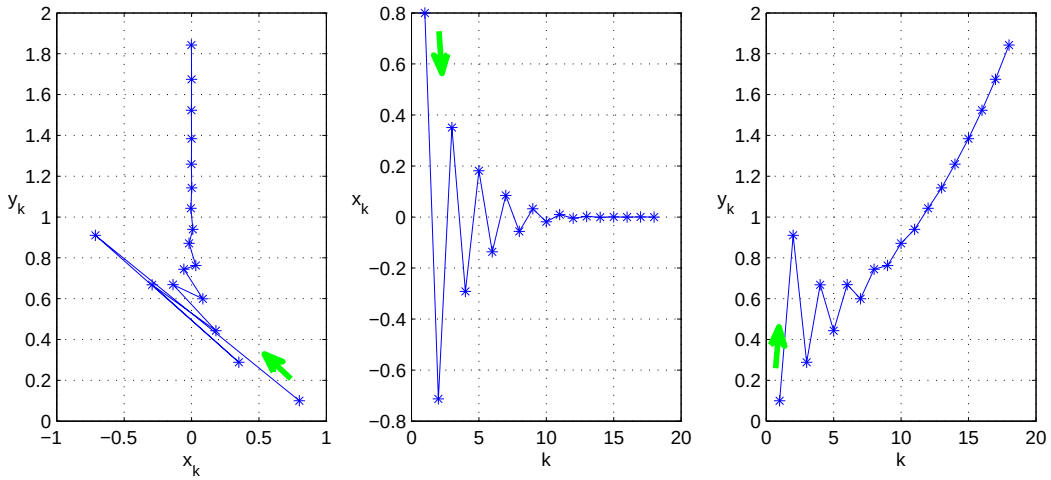

Figure 2: Case 2a ($|a| < 1, |b| > 1, b > 0$): $a = 0.9$, $b = 1.1$, $x_1 = 0.8$, $y_1 = 0.1$, $k = [1, 18]$.

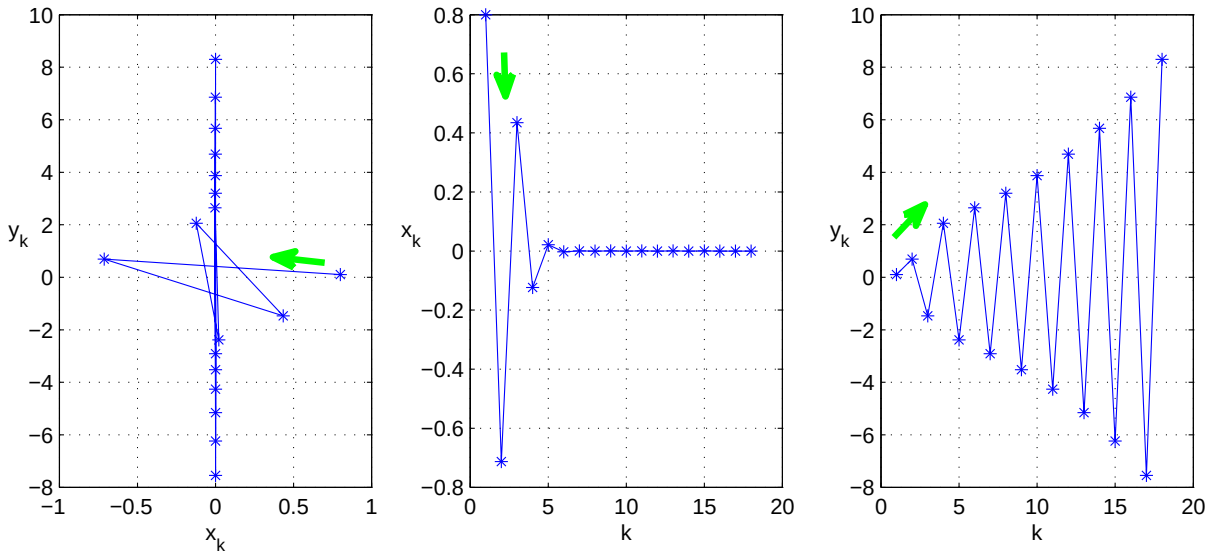

Figure 3: Case 2b ($|a| < 1, |b| > 1, b < 0$) : $a = 0.9$, $b = -1.1$, $x_1 = 0.8$, $y_1 = 0.1$, $k = [1, 18]$.

4. Case 3: $|a| > 1, |b| < 1$. The localization of global attractor.

Let $0 < \delta < 1$ and introduce the notations

$$R_y = \sqrt{|a| - 1 + \delta|a|}, \quad R_x = |b|R_y + \sqrt{a^2 - 1 + \delta a^2}.$$

Lemma 1. *If $|a| > 1$ and $|b| < 1$, then for any $|x_0|$ and $|y_0| > R_y$, one has*

$$|x_1| < |x_0|\frac{1}{1+\delta}.$$

Proof. Since

$$\begin{aligned} |x_0| - |x_1| &= |x_0|\left(1 - \frac{|a|}{1+y_0^2}\right) \geq |x_0|\left(1 - \frac{|a|}{1+R_y^2}\right) \\ &= |x_0|\left(1 - \frac{|a|}{1+|a|-1+\delta|a|}\right) = |x_0|\left(1 - \frac{1}{1+\delta}\right), \end{aligned}$$

one has

$$|x_1| \leq |x_0|\frac{1}{1+\delta}.$$

■

Lemma 2. *If $|a| > 1$ and $|b| < 1$, then for $|y_0| \leq R_y$ and $|x_0| > R_x$, one has*

$$|x_2| \leq |x_0|\frac{1}{(1+\delta)} < |x_0|.$$

Proof. For y_1, one has

$$|y_1| = |x_0 + by_0| \geq |x_0| - |by_0| \geq |x_0| - |b|R_y > R_x - |b|R_y = |b|R_y + \sqrt{a^2 - 1 + \delta a^2} - |b|R_y = \sqrt{a^2 - 1 + \delta a^2}.$$

Therefore,

$$\frac{a^2}{1+y_1^2} < \frac{a^2}{1+a^2-1+\delta a^2} = \frac{1}{1+\delta} < 1$$

and

$$|x_0| - |x_2| = |x_0| - \frac{a^2|x_0|}{(1+y_0^2)(1+y_1^2)} = |x_0|\left(1 - \frac{1}{(1+y_0^2)}\frac{a^2}{(1+y_1^2)}\right) \geq |x_0|\left(1 - \frac{1}{1+\delta}\right).$$

Consequently, $|x_2| \leq |x_0|\frac{1}{1+\delta} < |x_0|$.

■

By Lemma 1 and Lemma 2, one gets the following results.

Corollary 1. *For any x_0, y_0, there exists $n \in \mathbb{N}_0$ such that*

$$|x_n| \leq R_x.$$

Corollary 2. *If $|x_0| \leq R_x$, then $|x_m| \leq a^2 R_x$, $\forall m \geq 0$.*

Proof. Let $|x_1| > R_x$. If $|y_1| > R_y$, then $|x_2| \leq |x_1|$. If $|y_1| \leq R_y$, then $|x_3| < |x_1|$. Therefore,

$$|x_m| \leq \max(|x_1|, |x_2|) \leq |ax_1| \leq a^2|x_0| \leq a^2 R_x, \quad \forall m > 0.$$

■

Lemma 3. *If $|a| > 1$ and $|b| < 1$, then for $|x_0| \leq M$ and $|y_0| > \frac{M+\delta}{1-|b|}$, where $M > 0$ and $\delta > 0$, one has*

$$|y_1| < |y_0| - \delta < |y_0|.$$

Proof. Since

$$|y_0| - |y_1| = |y_0| - |by_0 + x_0| \geq |y_0| - |b||y_0| - |x_0| \geq |y_0|(1-|b|) - |x_0| > \frac{M+\delta}{1-|b|}(1-|b|) - M = \delta,$$

one has

$$|y_1| < |y_0| - \delta < |y_0|.$$

■

Corollary 3. *For $|x_0| \leq R_x$ and $|y_0| > \frac{a^2 R_x + \delta}{1-|b|}$, there exists $n \in \mathbb{N}_0$ such that*

$$|x_n| \leq a^2 R_x, \quad |y_n| \leq \frac{a^2 R_x + \delta}{1-|b|}.$$

Proof. By Corollary 2, one has $|x_n| \leq a^2 R_x$, $\forall n \geq 0$. By Lemma 3, there exists n such that $|y_n| \leq \frac{a^2 R_x + \delta}{1-|b|}$.

■

Lemma 4. *If $|a| > 1$ and $|b| < 1$, then for $|x_0| \leq M$ and $|y_0| \leq \frac{M+\delta}{1-|b|}$, where $M > 0$ and $\delta > 0$, one has*

$$|y_1| < \frac{M+\delta}{1-|b|}.$$

Proof.

$$|y_1| = |by_0 + x_0| \leq |b||y_0| + |x_0| \leq |b|\frac{M+\delta}{1-|b|} + M = \frac{M + |b|\delta}{1-|b|} < \frac{M+\delta}{1-|b|}.$$

■

Corollary 4. *If $|x_0| \leq R_x$, then there exists $N > 0$ such that*

$$|y_n| \leq \frac{a^2 R_x + \delta}{1 - |b|}, \quad \forall n > N.$$

Proof. By Corollaries 2 and 3, there exists $n > 0$ such that

$$|x_n| \leq a^2 R_x, \quad |y_n| \leq \frac{a^2 R_x + \delta}{1 - |b|},$$

where $|x_m| \leq a^2 R_x, \forall m \geq 0$. It follows from Lemma 4 with $M = a^2 R_x$ that

$$\forall k > n, \quad |y_k| \leq \frac{a^2 R_x + \delta}{1 - |b|}.$$

■

Therefore, by Corollaries 1,2 and 4 for any $x_0 \neq 0, y_0 \neq 0$, there exists $n > 0$ such that, $\forall k > n$,

$$|x_k| \leq a^2(|b|\sqrt{|a| - 1 + |a|\delta} + \sqrt{a^2 - 1 + a^2\delta}) = a^2 R_x,$$

$$|y_k| \leq \frac{a^2(|b|\sqrt{|a| - 1 + |a|\delta} + \sqrt{a^2 - 1 + a^2\delta}) + \delta}{1 - |b|} = \frac{a^2 R_x + \delta}{1 - |b|}.$$

Thus, all possible attractors are placed in the above absorbing set. Fig. 4 shows the absorbing set and a self-excited attractor[1].

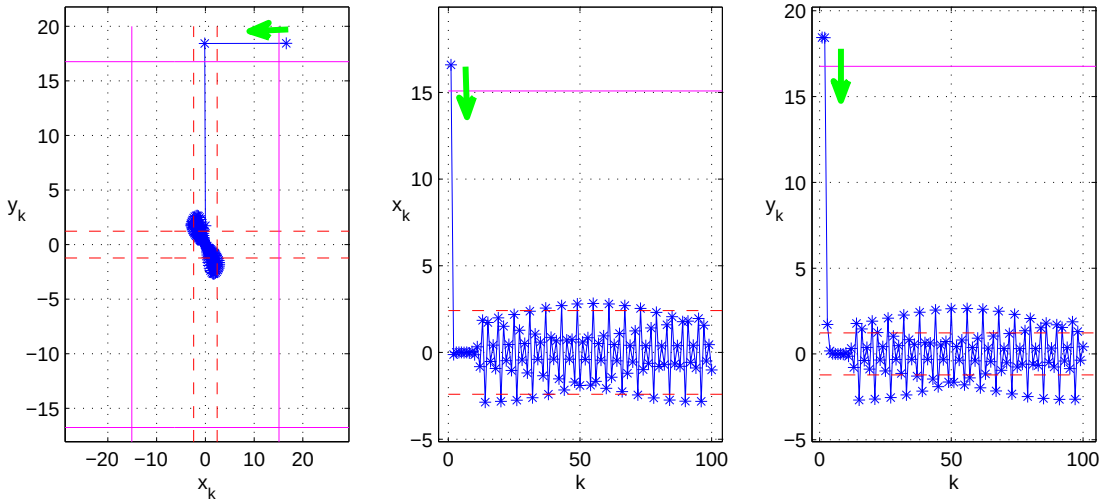

Figure 4: Case 3 ($|a| > 1, |b| < 1$) : $a = 2.5$, $b = 0.1$, $\delta = 0.00001$, $x_1 = 16.59$, $y_1 = 18.44$, $k = [1, 100]$.

[1] An attractor is called a self-excited attractor if its basin of attraction intersects with any open neighborhood of an equilibrium; otherwise, it is called a hidden attractor [8, 10–12]. Some recent examples of hidden attractors in continuous- and discrete-time dynamical systems can be found in [1, 2, 5–7, 9].

5. Case 4: $|a| > 1, |b| > 1$. The existence of unbounded solutions

Consider a certain δ satisfying $|b|^{-1} < \delta < 1$. Let $|y_0| \geq \sqrt{|a|-1}$ and $|x_0| \leq |y_0|(|b| - \delta^{-1})$. Then,

$$|x_1| = \left|\frac{-ax_0}{1+y_0^2}\right| \leq |x_0|, \quad |y_1| = |by_0 + x_0| \geq |by_0| - |x_0| \geq \delta^{-1}|y_0| > |y_0|,$$

and $|x_1| \leq |y_1|(|b| - \delta^{-1})$. Therefore,

$$y_k(y_0) \xrightarrow[k\to\infty]{} \infty.$$

Fig. 5 shows a solution, which tends to infinity.

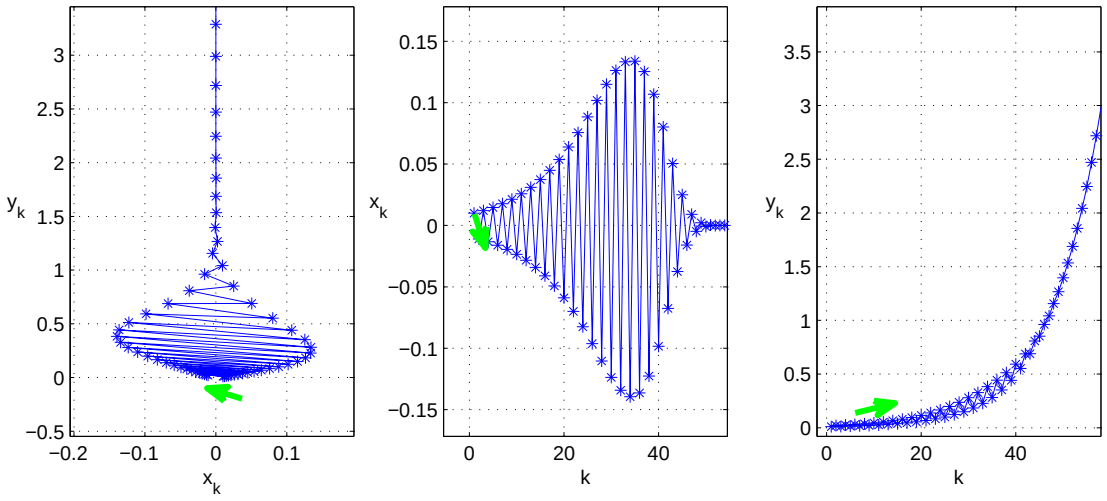

Figure 5: Case 4 ($|a| > 1, |b| > 1$): $a = 1.1$, $b = 1.1$, $x_1 = 0.01$, $y_1 = 0.01$, $k = [1, 60]$.
